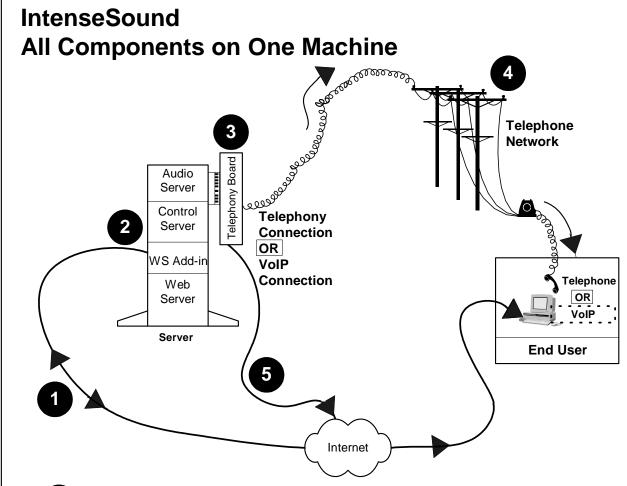

Figure 1-1: IntenseSound All Components On One Machine

- The Network delivers user requests for audio and web content to the Web Server. Also, the network delivers visual Web content to user, synchronized with audio.
- As appropriate, Web Server add-in routes requests to Web Server or Audio Server via (Control Server).
- 3 Audio requests are delivered by Audio Server through a standard telephony board.
- The audio travels either over the telephone network (for a phone connection) to the user's phone, synchronized with the user's actions.

 OR
- The audio travels over the network (for Voice over IP) to the user's Voice over IP client software, synchronized with the user's actions.
